Metal halide lamps are mercury medium pressure lamps, where the spectra are matched with the activation spectra of photo-initiators and substrates by the addition of metal halides.

Heraeus Noblelight offers a wide range of standard models from stock. Particular customer requirements can be matched by changing the metal halide content and by designs.

The lamps find application in a wide range of industries:
- Reprography
- Photo-chemistry
- Photo-polymerisation
- Curing of paint and lacquers
- Curing of adhesives
- Sewer rehabilitation
- Dental technology
Heraeus Noblelight offers a wide range of Metal Halide lamps to suit a host of different industrial and scientific applications. In co-operation with customers, Heraeus develops radiation sources, which are specially matched to customers’ specifications and processes.

The product range for Metal halide lamps extends from 100 W to 8000 W in various designs. Both standard sockets and customer-specific connectors are available. Consequently, bearing in mind that metal halide lamps can also have various dopings, customers can select UV lamps from a very wide product range to ensure that the one they choose is best suited to their process. This saves energy, maintenance and operating costs and improves quality and process.

Metal halide lamps are most commonly used for applications requiring enhanced spectral outputs.

Available standard spectra. Other on request.
